Adedayo Adebanjo

Senior Full Stack Software Engineer

dahyor@outlook.com
+44 7399 829354 | Leeds, UK | linkedin.com/in/dayo-adebanjo | github.com/dahyorr | dayo.dev

PROFESSIONAL SUMMARY

Software Engineer with 5+ years of production experience designing and delivering scalable web applications and backend services using TypeScript, Node.js, Python, Go, PostgreSQL and AWS. Owns systems end to end, from technical design and data modelling through deployment, monitoring and security hardening, with a track record of shipping customer-facing features across distributed startup teams in Singapore, San Francisco and Lagos. Completing an MSc in Cybersecurity and applying application-security practice directly to production work.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, Go, Rust, SQL

Backend: Node.js, NestJS, GraphQL, FastAPI, Django, Flask, REST API design

Frontend: React, Next.js

Data: PostgreSQL, MongoDB

Cloud & Infra: AWS, GCP, Docker, CI/CD, Linux, Git

Testing & Security: Jest, authentication and authorisation design (JWT, RBAC), OWASP Top 10

PROFESSIONAL EXPERIENCE

Full Stack Developer, Staytion | Remote (Singapore) — September 2022 – Present

- Led end-to-end development of multiple full-stack features in Next.js, Node.js, and GraphQL, owning everything from technical design through deployment and post-release monitoring.
- Hardened the GraphQL layer by enforcing JWT authentication across all roles and implementing column-level permissions to prevent over-exposure of sensitive fields.
- Led remediation of a third-party penetration test against the production servers and Hasura backend, closing high-severity security issues and unnecessary data exposures.
- Optimized database queries by 20%, improving application performance and reducing page load times.
- Spearheaded the development of a digital onboarding process for business partners, reducing onboarding time by 80%.
- Designed and built a shared React component library used across multiple production applications, improving consistency, reducing duplicate code, and accelerating feature delivery across the frontend team.
- Worked directly with product and design to scope ambiguous requirements, often shaping technical approach before implementation began.
- Wrote unit and integration tests in Jest to cover critical business logic and reduce regressions across frequent releases.

Full Stack Developer (Contract), Medium Biosciences – Remote (San Francisco, CA)

September 2022 – November 2023

- Built a full-stack platform to run the 2023 protein engineering tournament by The Align Foundation, handling participant submissions, scoring, and result visualization for a global research audience.
- Engineered and optimized REST web services using FastAPI for managing dynamic datasets and improving the performance of applications by 30%.
- Deployed and operated the platform on AWS using EC2 and Elastic Beanstalk behind load balancers, with S3 for dataset and submission storage.
- Integrated machine learning models into applications via REST APIs, improving data-driven decision-making for end-users.
- Partnered with designers to enhance UI/UX across the platform's core research workflows.

Software Developer, Instiq Professional Services - Lagos, Nigeria April 2021 – August 2022

- Delivered 5+ client applications as part of a small engineering team, taking technical lead on UI design and contributing to backend development across several projects.
- Built a crowd control system for a major Nigerian bank using React and Node.js, reducing customer service times by 20%.

- Designed and built REST APIs to spec across multiple client projects, integrating with third-party services and internal data sources.
- Reduced page load times by 50% through various query optimizations, reducing bundle sizes and targeted bug fixes.

PROJECTS

FirmScan - Automated IoT Firmware Security Assessment Pipeline
Python, FirmAE/QEMU, Valkey, PostgreSQL, WebSockets - MSc dissertation - github.com/dahyorr/firmware-lab

- Sole architect and developer of an orchestration pipeline that emulates router and IP-camera firmware at scale and runs automated security analysis against the live emulated device.
- Built an event-driven backend using Valkey pub/sub with asyncio fan-out over WebSockets for live run streaming.

Duplicast - Local RTMP Relay
TypeScript, Rust - github.com/dahyorr/duplicast

- Built a self-hosted service that ingests a single RTMP stream and relays it concurrently to multiple broadcast destinations, replacing paid SaaS relays that route user traffic through third-party servers.
- Chose Rust for memory-safe, low-overhead concurrent stream forwarding; designed the connection handling and fan-out model from scratch.

DevUtils
Go, TypeScript, AWS Lambda, S3 - https://github.com/dahyorr/DevUtils

- Built a web platform of developer tools covering file hashing, encoding, and format conversion between JSON, YAML and XML.
- Offloaded file processing to an AWS Lambda worker with S3 for upload and result storage, keeping large-file conversion off the request path.

EDUCATION

Msc In Cybersecurity, Leeds Beckett University, *Leeds, West Yorkshire* | Sept 2026
Bachelor of Science in Industrial Physics - Electronics and IT Applications, Covenant University, *Ota, Ogun State* | Dec 2020

CERTIFICATIONS

AWS Certified Developer - Associate, Amazon Web Services Training and Certification | July 2023
